DBMS getting pounded?

Types of Validation

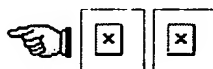

ASP.NET Web Forms Web Forms Validation

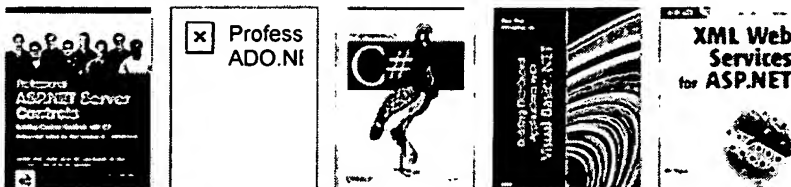

The following table lists the types of validation controls available and how you can use them.

Type of validation	Control to use	Description
<u>Required entry</u>	RequiredFieldValidator	Ensures that the user does not skip an entry.
<u>Comparison to a value, to a data type, or to a database value</u>	CompareValidator	Compares a user's entry against a constant value, a value derived from another control, or a database value using a comparison operator (less than, equal, greater than, and so on).
<u>Range checking</u>	RangeValidator	Checks that a user's entry is between specified lower and upper boundaries. You can check ranges within pairs of numbers, alphabetic characters, and dates. Boundaries can be expressed as constants or as values derived from another control.
<u>Pattern matching</u>	RegularExpressionValidator	Checks that the entry matches a pattern defined by a regular expression. This type of validation allows you to check for predictable sequences of characters, such as those in social security numbers, e-mail addresses, telephone numbers, postal codes, and so on.
<u>User-defined</u>	CustomValidator	Checks the user's entry using validation logic that you code yourself. This type of validation allows you to check for values derived at run time.

You can attach more than one validation control to an input control. For example, you might specify that a control is both required and that it contain a specific range of values.
